                                                                                                                                                                                                                                                                             Tryptic peptides (AAW18338-42) were isolated from bovine retinal pigment epptihalial (RPE) membrane protein p32. PCR primers (see also AAT68946-49) based on these primers were used to amplify CDNA (see also AAT68935) coding for bovine p32 (AAW18343) from a RPE CDNA library. Peptide p322 corresponds to amino acids 281-288 of the p32 sequence deduced from the CDNA clone. p32 is an 11-cis retinol dehydrogenase and forms a complex with a component of the membrane receptor for retinol binding protein
                                                                                                                                                                                                                    New 11-cis retinol dehydrogenase gene - used to develop products for the diagnosis and therapy of conditions such as retinitis pigmentosa,

AAY01989-93 represent peptide obtained after tryptic digest of a p32 protein, isolated in the course of the invention. The specification describes proteins having retinol dehydrogenase activity, such as 9-cis, 1-cis, 13-cis, or trans retinol dehydrogenase activity. These proteins form oligomeric protein complexes with the components of the membrane ceptor for retinol binding protein. The retinol dehydrogenase proteins are members of the short chain alcohol dehydrogenase family. The recombinant enzymes can be used to produce 9-cis and 11-cis recombinant enzymes can be used to produce 9-cis and 11-cis recombinant retinoid drugs for treatment of various diseases, con as psortails retinoid drugs for treatment of various diseases, con as psortails retinoid argament of various diseases, con as psortails and acne. Certain T-cell leukemiss may also be tested by retinoid drugs. Antibodies against the protein can be used to monitor pathological conditions characterized by aberrant levels of a receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antiAIDS; vaccine; cancer; immune; autoimmune disorder; immunodeficiency;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (BIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                        This invention describes novel antibodies that immunospecifically bind to
                                                                                                                                                                                                                                                              B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostetic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAlDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Variable region V3, found in the envelope protein gp120 of an AIDS or ARC
                                                                                                      Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligopeptide(s) corresp. to beta-turn variable region of gp.120 - used for diagnosis of and prodn of vaccines against AIDS and ARC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Preferably at least one set of the covalent linkages is comprised of melenide derivatives; the (poly)anionic moiety is composed of one to five residues of the anionic (poly)anionic moiety is composed of one to five residues of the anionic protein is the ovuter membrane protein complex (OMFC) of Neisseria meningitidis b; and the PND peptide has a linear structure, a disulphidebonded cyclic structure or a thioether-
The peptides of the invention comprise the beta-turn AA SQ GPG or GPGR at positions 312-314 or 312-315 in the AA numbering of HITU-IIIB (BHI0) and flanking AA SQs having a length equal to or greater than 1 and prefequal to or greater than 2 AAs; variants in which the GPG or GPGR SQ has been replaced by a different beta-turn SQ; and variants in which the free NH2-terminal gp AA and/or the free carboxyl terminal gp. AA has been blocked or modified otherwise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "bonds to the OMPC of the conjugate via this site"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       used as part of a conjugate comprising the major immune enhancing protein (MIEP) of Neisseria meningitidis covalently linked to the HIV PND. The conjugate may be used to prepare vaccines against HIV infections, e.g. AIDS, as research tools for studying PND structure-function relationships, or as immunogens for use in the passive immunisation of humans. (Updated on 25-MAR-2003 to correct PN field.)
bonded cyclic structure. The present sequence (PND-MAL) is an example of a PND peptide component used in the co-conjugate. The co-conjugate is useful for inducing anti-Peptide immune response in mammals, for inducing HIV-neutralizing antibodies in mammals, for formulating vaccines to prevent HIV infection or disease, including AIDS, or for treating humans afflicted with HIV infection or disease

Pref. the immunogenic protein is the outer membrane protein complex (OMPC) of Neisseria meningitidis b and the PND peptide has a linear structure, a disulphide-bonded cyclic structure. In a manded-bonded cyclic structure. The present sequence (PND-MAL) is an example of a PND peptide component. The conjugates are used for inducing HIV-neutralising antibodies or for making vaccines to prevent contraction of HIV infection or disease. The antibodies can be used for passively protecting against infection by HIV, or for protecting against proliferation of HIV post-infection, or for treating AIDS, or in diagnostic assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HIV peptide-polygaccharide-protein conjugates - used in vaccines or to produce antibodies to prevent or treat HIV infection.
                                                                                                                                                                                                 /note= "Joins onto polysaccharide-protein complex via

The invention relates to an isolated viral polypeptide having phospholipase A2 (PLA2) activity (e.g Vlup from parvoviruses) and the polypolipase A2 (PLA2) activity (e.g Vlup from parvoviruses) and the polymucleotides encoding them. Also included are a peptide that competed a viral phospholipase A2 being (WY) -(CIVL) -G-x-(GP) - (GTMS) -x(B.14)-D-x(2)-(AC)-x(2)-H-D-x(2)-Y. () = indicates the presence of one of the enclosed maino acids and x(B.14) = a stretch of a mino acids, and x(B.14) = a stretch of a mino acids, and x(B.14) = a stretch of complementary to the polymucleotide variant of a viral polypeptide comprising an amino acid motif as detailed above, an antisense oligomucleotide comprising the vector, producing a complementary to the polymucleotide, a vector comprising the vector, producing a recombinant virus comprising genetically engineered viral particles with the polymucleotide, fragment or vector, an antibody that bind to the polymucleotide fragment or vector, an antibody that bind to the polymucleotide is useful for gene therapy vector is based on an adenotinerapy vector, where the gene therapy vector is based on an adenotassociated virus. The antisense oligomucleotide is useful for metapy vector is based on an adenotassociated virus. The antisense oligomucleotide is useful for metapy vector is based on an adenotassociated virus and virus in a subject, for manufacturing a subject or to treat viral apent is used to decrease the infectivity and/or replication of a virus in subject has a viral-associated disease. The polypeptide is used to decrease the infectivity and/or replication of a virus, e.g. parvovirus, in a subject. The antisense oligomucleotide is used to decrease the infectivity and/or replication of a virus, e.g. parvovirus, in a subject. The antisense or the polypeptide is used to decrease the infectivity and/or replication of a virus, e.g. parvovirus, in a subject. The antisense or disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                     New viral phospholipase A2 enzymes, useful in gene therapy for treating a subject viral-associated disease, e.g. rheumatoid arthritis, systemic erythematosus, adult-onset Still's disease or polyarthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           particularly a disease associated with a parvovirus. The viral-associated disease includes rheumatoid arthritis, systemic erythematosus, adult-onset Still's disease or polyarthritis. The present sequence is a a phage-displayed peptide which binds parvovirus VPlup peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 30; DB 5; I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  response comprising administration of a lymph node targeting peptide attached to an immunogen. The invention also comprises a bispecific compound comprising the sequences (ys.Ala.Tyr or Ser-Cys.Ala.Tyr, a bispecific compound comprising a targeting peptide attached to a vector binding moiety and a method for targeting a vector to an organ or tissue comprising administering the vector and a complex comprising a targeting peptide and a binding moiety. The peptides of the invention may have cytostatic, anti-HIV or immunostimulant activities. The method of the invention is useful for increasing the immune response to an immunogen, especially a cancer cell or human immunodeficiency virus (HIV). The method is useful for the selective delivery of gene therapy vectors. The present sequence represents an adenovirus homing peptide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Phospholipase A2; enzyme; PLA2; virucide; antirheumatic; antiarthritic; immunosuppressive; parvovirus; Vlup; gene therapp; viral-associated disease; rheumatoid arthritis; systemic erythematosus; adult-onset Still's disease; polyarthritis; phage display.

The sequences given in AAR47668-788 are HIV-specific selected principal neutralisation epitopes which may be used in an antigenic conjugate linked to purified outer membrane proteosome of Neisseria. This conjugate may be used in an AIDS vaccine which may be used pre- and post-exposure to prevent or treat HIV infection or disease. The vaccine is capable of eliciting specific HIV neutralising antibodies and bind the broadly neutralising human monoclonal antibody (447 antibody). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                            New conjugates for treating or preventing HIV infection - comprising HIV-specific neutralisation epitopes covalently linked to outer membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New human source of immunodominant MHC-associated peptide (SIMP) nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 source of immunodominant MHC-associated peptide; SIMP; MHC; major histocompatibility complex; human leukocyte antigen; HLA; cytostatic; immunosuppressive; antisense therapy; gene therapy; lung cancer; arcoma; prostate cancer; testicular cancer; melanomas; pancreatic cancer; haematological cancer; immune response; lymphoid cell proliferation; autoimmune disease; transplant rejection; SIMP-derived peptide; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            neutralisation epitopes which may be used in an antigenic conjugate linked to purified outer membrane proteosome of Neisseria. This conjugate may be used in an AIDS vaccine which may be used pre- and post-exposure to prevent or treat HIV infection or disease. The vaccine is capable of eliciting specific HIV neutralising antibodies and bind the broadly neutralising human monoclonal antibody (447 antibody). (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                             New conjugates for treating or preventing HIV infection - comprising HIV-specific neutralisation epitopes covalently linked to outer membrane

ó
   breast cancer, or for suppressing an immune response in an autoimmune sease.
                                                                                             This invention relates to a novel isolated or purified human protein, termed source of immunodominant major histocompatibility complex (MHC)-sasociated peptide (SIMP), which is expressed ubiquitously in human cells, where the protein has the potential of generating several protein fragments binding with high affinity to a human leukocyte antigen (HLA) molecule. The invention may allow development of therapeutics with autisense therapy or gene therapy. The source of immunodoplant MHC associated peptide (SIMP) nucleic acids, proteins and fragments are useful for associated peptide (SIMP) nucleic acids, proteins and fragments are useful for associated peptide (SIMP) nucleic acids, proteins and fragments are useful for diagnosing and treating cancers, for example lung cancer,
                                                                                                                                                                                                                                                                     intestine cancer, sarcomas, prostate cancer, testicular cancer, breast cancer, melanomas, pancreatic cancer or haematological cancer. The SIMP proteins are also useful for modulating an immune response. Decreasing lymphoid cell proliferation is useful for suppressing an immune response responsible for an autoimmune disease or a transplant rejection. The present sequence is that of a human SIMP-derived peptide (with a high efficier, binding maniferation).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HIV-specific; principal neutralisation; epitope; antigen; conjugate; outer membrane proteosome; Neisseria; AIDS; vaccine; HIV; infection; disease; antibody; human; monoclonal antibody; 447 antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;
                                                                                                                                                                                                                                                                                                                                                                            affinity binding motif for HLA molecules) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                          50.0%; Score 29; DB 7; Length 10; 80.0%; Pred. New conjugates for treating or preventing HIV infection - comprising HIV-specific neutralisation epitopes covalently linked to outer membrane

proteosome of Neisseria.

```
.
0
                                                      neutralisation epitopes which may be used in an antigenic conjugate linked to purified outer membrane proteosome of Neisseria. This conjugate may be used in an ALDS vaccine which may be used pre- and post-exposure to prevent or treat HIV infection or disease. The vaccine is capable of eliciting specific HIV neutralising antibodies and bind the broadly neutralising human monoclonal antibody (447 antibody). (Updated on 25-MAR -2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunosuppressive, immunostimulatory, antiinflammatory, cytostatic, neuroprotective, antimicrobial; gene therapy, vaccine, amylase, cancer, amyloid protein; angiopoietin; apoptosis related protein; cadharin, cyclin; polymerase, oncogene, histone, kinase, colony stimulating factor, complement related protein; cytochrome; kinasin, cytokine, interferon; interleukin; G-protein coupled receptor; thiossterase; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by one such oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with
                                The sequences given in AAR47668-788 are HIV-specific selected principal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer autoimmune diseases and infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            e.g. cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide ligands with affinity for immunoglobulin (Ig) G, IgM and/or human serum albumin which may be conjugated to, and used to prolong the elimination half-time of active agents from the circulation.
inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel peptide ligands with affinity for immunoglobulin (Ig) G or serum albumin. The peptide ligands may be conjugated to, and used to prolong the elimination half-time of, therapeutic and diagnostic agents in the body. The present sequence is a human albumin-binding peptide used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Antigen binding structures containing CDR's recognising the CA55.1 antigen - produced by hybridomas and host cells, for use in the diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            An antigen binding structure (I) is based on the CDRs (given in AAR76078-84) of the heavy and light chains of MAD 55.1 (ECACC 93081901), which recognises the colorectal tumor-associated antigen CA55.1. The peptide given in AAR76078, as displayed on the surface of phage NCIMB 40638, binds to (I) with an effective binding of 10 pM or less, and competitively inhibits binding of (I) to Colo 205 cells (ATCC CCL 222). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Non-crosslinked protein particle, diagnostic, therapy, monodisperse, albumin, haemoglobin, nanometer, micrometer, clearance.

Pharmaceutical composition useful for promoting weight loss, comprises an insect adipokinetic hormone, having a pyroglutamate residue at its amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method of promoting lipid mobilisation in a human which comprises administering an insect adipokinetic hormone (AKH). The hormone of the invention demonstrates anorectic, antidiabetic, hypotensive, cardiant, antiathrhitic, cytostatic, nephrotropic, analgesic, cerebroprotective and uropathic activities. The method of the invention may be useful for treating obesity, type II diabetes, choleithhiasis, hypertension, coronary heart disease, atherosclerosis, types I to VI glycogenosis, arthritis, cancer, renal failure, liver disease, chronic pain, sleep apnea, stroke and urinary incontinence. The current sequence is that of the giant Madagascar hissing cockroach AKH peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human platelet glycoprotein Ib/IX complex epitope; mimotope; probe; monoclonal antibody C-34; anti mimotope; binding site; antibody; platelet adhesion; aggregation; agglutination; von Willebrand factor; anti thrombotic drug; ristocetin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human platelet glycoprotein {
m Ib/IX} complex epitope mimotope.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel aqueous suspension of monodisperse particles on non-crosslinked, non-denatured albumin (50-5000 nm) which is stable against dissolving upon dilution with an alcohol-free aqueous medium. The method involves (a) forming an aqueous solution containing albumin and hemoglobin and (b) treating the aqueous solution with an alcohol to cause the solution to become turbid. The particles are useful as agents for in vivo administration, either of their own administration or as a vehicle for other therapeutic or diagnostic agents. The method permits the formation of albumin and hemoglobin particles in the nanometer and micrometer size range, in a form closer to their natural form than the forms of the prior art. The particles therefore constitute a more closely controlled agent for in vivo administration, with greater ease of clearance from the body after their period of usefulness.

AAY30552-Y31135 represent peptides used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                lipid mobilisation; insect; adipokinetic hormone; AKH; anorectic; antidiabetic; hypotensive; cardiant; antiarthritic; cytostatic; antidiabetic; papartotropic; analgesic; cerebroprotective; uropathic; obesity; type II diabetes; cholelithiasis; hypertension; coronary heart disease; atherosclerosis; glycogenosis; arthritis; cancer; renal failure; liver; chronic pain; sleep apnea; stroke; urinary incontinence; giant Madagascar hissing cockroach.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Non-crosslinked protein particles for therapeutic and diagnostic use.

The present sequence represents a mimotope which functionally mimics a binding site for a monoclonal antibody (Mbb) which recogniess an epitope within the human platelet glycoprotein (gp) Ib/IX complex. More repetifically the Mbb is C-34. The mimotope peptide can be used for raising antibodies, as probes to search for anti-mimotopes and to neutralise the inhibitory activity of those antibodies which recognise the epitope which is mimicked by the peptide. Anti-mimotopes can be used to modulate the adhesion, aggregation or agglutination of platelets by affecting von Willebrand factor interaction with the platelets through ristocetin induced aggregation of platelets
                                                                                                                             Peptide which mimics human platelet glycoprotein Ib/IX complex epitope also anti-mimotope molecule capable of binding to the peptide and useful to modulate platelet adhesion, aggregation or agglutination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mimotope; monoclonal antibody C-14; human; glycoprotein Ib/IX complex; binding site; platelet epitope; neutralise; aggregation; inhibition; von Willebrand factor interaction; adhesion; agglutination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mimotope capable of binding to monoclonal antibody C-34 #33.
                                                                                                                                                                                                                                                                                                                                                                                                                            Score 28; DB 2; Length 12;

Peptides that mimic platelet epitope - and neutralise aggregation-

Disclosure; Col 5; 26pp; English.

inhibiting antibody

```
The present invention provides peptides which functionally mimic a binding site for a monoclonal antibody, where the monoclonal antibody crecopilates an epitope within the human glyoprotein ID/IX complex.

CC recognises an epitope within the human glyoprotein ID/IX complex.

CC recognises an epitope within the human glyoprotein ID/IX complex.

CC molecule capable of binding the mimotopes which are capable of binding the mimotopes, where the molecule can be an antibody, a second peptide, a carbohydrate, a DNA molecule, an RNA concluse are called anti-mimotopes, where the mile infrombotic drugs.

CC molecules are called anti-mimotopes and can act as anti-thrombotic drugs.

A method has also been described for modulating the adhesion,

aggregation, or agglutination of platelets, where the method comprises

CC exposure affects von Willebrand factor interaction with platelets through

CH aggregation, or agglutination of the platelets. The peptide mimotopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an immunogenically modified fusion protein derived from a parent fusion protein, comprising first and second proteins/pollypeptides, where the first protein is an immunoglobulin molecule or its fragment and the second protein is non-immunoglobulin target polypeptide each linked to the other directly or by a linker
                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New modified fusion protein with reduced immunogenicity, useful for combining favorable properties of a composition, comprises an immunoglobulin molecule linked to a non-immunoglobulin target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Williams S;

             combining known favourable properties of a composition or in creating new properties of a composition which elicits biological or pharmacological efficacy without having undesirable physiological effects such as nausea or gastric upset. The present sequence is human beta-glucocerebrosidase (beta-GCR) peptide with potential major histocompatability complex (MHC) binding activity. The beta-GCR peptide is also referred to as b-b-glucosyl-N-acylsphingosine glucohydrolase (B.C.3.2.1.45). This peptide is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                neutralisation epitopes which may be used in an antigenic conjugate linked to purified outer membrane proteosome of Neisseria. This conjugate may be used in an AIDS vaccine which may be used pre- and post-exposure to prevent or treat HIV infection or disease. The vaccine is capable of eliciting specific HIV neutralising antibodies and bind the broadly neutralising human monoclonal antibody (447 antibody). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HIV-

This conjugate may be used in an AIDS vaccine which may be used pre- and post-exposure to prevent or treat HIV infection or disease. The vaccine is capable of eliciting specific HIV neutralising antibodies and bind the broadly neutralising human monoclonal antibody (447 antibody). (Updated on 25-MAR-2003 to correct PN field.)

clusterin. The present sequence represents a rat clusterin peptide from an example of the present invention. Also described is a method for treating rejection in organ and tissue transplant, autoimmune diseases or inflammatory diseases by administering an effective dose of the immunosuppressant. The immunosuppressants are useful for preventing rejection in organ and tissue transplant, particularly of heart, liver, lung, panoreas, kidney, small intestine, skin and bone marrow, and as remedies for autoimmune diseases such as rheumatism, atopy, systemic erythematosus, and inflammatory diseases including allergy such as hay fever. The drugs are efficacious, with little side-effects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunosuppressants with reduced side-effects, useful for preventing rejection in organ and tissue transplant and as remedies for autoimmune diseases and inflammatory diseases (claimed) e.g. allergy.
                                                                                      Clusterin; immunosuppressant; organ rejection; tissue transplantation; autoimmune disease; inflammatory disease; rheumatism; atopy; systemic erythematosus; allergy; hay fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IgE receptor; immunoglobulin; FcepsilonRI; antagonist; phage display; protein co-ordinate data; IgE-mediated disease; allargic rhinitis; asthma; allergic asthma; atopic dermatitis; urticaria-angloedema; parasitic infection; IgE mediated disorder; inflammatory disorder; diabetes mellitus; reperfusion injury; stroke; IgE-mediated gastrointestinal inflammatory disease; burn; immune rejection of graft; myocardial infarction; atherosclerosis; acute lung injury; haemorrhagic shock; septic shock; acute tubular necrosis; endometriosis; degenerative joint disease;

Also included are a tusion protein comprising the peptide, a pharmaceutical composition (C) comprising the peptide, a compound that mimics the three-dimensional surface that mimics of the peptide, a compound with a solvent accessible surface that mimics of the peptide, a compound with a solvent accessible surface defined by the side chains of residues (R) of the specific, Cysi, C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A peptide useful for treating a IgE-mediated disease or disorder in a host e.g. allergic rhinitis, asthma, which competes with immunoglobulin E for binding to high affinity IgE receptor in an in vitro assay.
                                                                                                                                                                                                                                      GE Fcepsilon RI binding peptide from phage displayed g8 library IGE69.

The invention relates to a peptide which competes with immunoglobulin (19) B 134 comprising a sequence (S1), for binding the high affinity IgE receptor (PecpationRI) in an in vitro assay and having a formula given in the specification. Also included are a fusion protein comprising the peptide, a pharmaceutical composition (C) comprising the peptide, designing a compound that mimics the three-dimensional surface that mimics the solvent accessible surface defined by the side chains of residues (R) Pro4, Phe6, Pro16, Cys3, Cys15 and Cys19 of IgE134, a peptide with structural coordinates as given in the specification, selecting a peptide mimetic which binds to Foepsilon I and blocks binding of IgE and a peptide mimetic which mimics the coordinates of IgE134 residues (R). (C) is useful for inhibiting the binding of IgE to high affinity IgE receptor (FcepsilonRI). Peptides of the formula given in the specification are useful for inhibiting the binding of an IgE to high affinity IgE receptor. The peptide is useful for selecting a molecule which blocks the

```
The invention relates to a peptide which competes with immunoglobulin (C (Ig) E 134 comprising a sequence (S1), for binding the high affinity IgE receptor (FerepsilonR) in an in vitro assay and having a formula given in the specification. Also included are a fusion protein comprising the peptide, a pharmaceutical composition (C) comprising the peptide, a pharmaceutical composition (C) comprising the peptide of the peptide a compound with a solvent accessible surface that minics the solvent accessible surface defined by the side chains of residues (R) for the solvent accessible surface defined by the side chains of residues (R) prof. (Cy3, Cy3, Cy3), Cy51s and Cy39 of IgB134, a peptide with structural coordinates as given in the specification, selecting a peptide minetic which minics the coordinates of IgB134, a peptide with structural coordinates as given in the specification, selecting a peptide minetic which minics the coordinates of IgB134, a spetide with consideration of is useful for inhibiting the binding of IgB to high affinity IgB receptor. (FeepsilonR). Peptides of the formula given in the specification are useful for inhibiting the binding of IgB to high affinity IgB receptor. The peptide is useful for reacting an IgB to high affinity IgB receptor. The peptide is useful for treating an IgB mediated disease or disorder in host. (C) is useful for inhibiting the sectivation of high affinity IgB receptor. The peptide is useful for treating an IgB mediated disease or disorder in a sociated processes such as IgB- dependent activation and degranulation of maternal and basophils, as well as consequent release of inflammatory mediators such as histamine. (C) is useful for treating and allergic contraction and pasophils, as well as section of gastocintestinal inflammatory disorders, diabetes mediators inflammatory disorders, diabetes mediators of gastocintestinal inflammatory disorders, diabetes mediators of contractions injury, haemorrhagic shock, mycardial inflammatory is appetide of the inventue sequence is 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 H
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     IGE Fcepsilon RI binding peptide from phage displayed g8 library IGE68

                                                                                                                                                                                                                                                                             The invention relates to a peptide which competes with immunoglobulin (1g) E 134 comprising a sequence (S1), for binding the high affinity IgE receptor (ReceptailonE1) in an in vitro assay and having a formula given in the specification. Also included are a fusion protein comprising the cespetide, a pharmaceutical composition (C) comprising the peptide, a compound with a solvent accessible surface that minics the protein coessible surface that minics the solvent accessible surface that minics the solvent accessible surface defined by the side chains of residues (R) brod, Pabe, Pro16, Cys3, Cys7, Cys15 and Cys19 of IgE134, a peptide with a structural coordinates as given in the specification, selecting a peptide mimetic which binds to ReepsilonR1 and blocks binding of IgE and americ which binds to ReepsilonR1 and blocks binding of IgE and selecting a peptide mimetic which mimics the coordinates of IgE134 residues (R). (C) is useful for inhibiting the binding of IgE to high affinity igE receptor (Receptor The peptide is useful for selecting a molecule which blocks the interaction of IgE with high affinity IgE receptor. The peptide is useful for realing an IgE-mediated disease or disorder in a costill for inhibiting and particular of high affinity IgE receptor. The peptide is useful for inhibiting and activation of high affinity IgE receptor. The peptide is also useful for inhibiting and pasophils, as well as consequent release of associated processes such as IgE-dependent activation and degranulation of mast cells and basophils, as well as consequent release of alsorder of mast cells and basophils, as well as consequent release of alsorder inflammatory disease, immune rejection of grafts, curlicaria-angioedema, parasitic infection, IgE mediated processes such as larging as allergic asthma), atopic dermatitis, curlicaria-angioedema, parasitic inflammatory disease, immune rejection of grafts, reperfusion injury, stroke, more shock, burn, sentic suche rinher of gastroinestianal inflammatory disease, immune rejection
                                                                                                                                                                           A peptide useful for treating a IgE-mediated disease or disorder in a host e.g. allergic rhinitis, asthma, which competes with immunoglobulin E for binding to high affinity IgE receptor in an in vitro assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1;

The invention relates to CERVIG proteins and polynucleotides encoding such proteins. Sequences of the invention are useful in modulating signal regulatory proteins (SIRP) alpha-CD47 functions and in treating conditions such as inflammation, pullmonary diseases, urinary diseases, central nervous system diseases, immune diseases and gastrointestinal tract diseases. They are particularly used to inhibit the development of TH1-type immune response, undesirable effects of graft versus host disease and autoimmune syndromes, inhibit inappropriate RBC destruction in cautoimmune haemolytic anaemia or related diseases and improve memory. CRRVIG sequences are also used in gene therapy. The present sequence is a phage peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

```
The invention relates to a co-conjugate comprising an immunogenic protein or protein complex having a first set of covalent linkages to low molecular weight moieties which have an anionic or polyanionic character at physiological pH, and a second set of covalent linkages to peptides or physiological pH, and a second set of covalent linkages to peptides comprising HIV principal neutralizing determinants (PND's) or munonojoically equivalent peptides. Preferably at least one set of the covalent linkages is comprised of maleimide derivatives; the covalent linkages is composed of one to five residues of the anionic (polly) anionic moiety is composed of one to five residues of the anionic corn of a carboxylic, sulphonic or phosphonic acid; the immunogenic protein is the outer membrane protein complex (OMPC) of Naisseria meningitidis b, and the PND peptide has a linear structure, a disulphidement of conded cyclic structure, an amide-bonded cyclic structure. The present sequence (cPND) is an example of a bonded cyclic structure. The present sequence (cPND) is an example of the component used in the occonjugate. The co-conjugate is the confound anti-peptide immune response in mammals, for inducing HIV-neutralizing antibodies in mammals, for formulating vaccines to afflicted with HIV infection or disease, including AlDS, or for treating humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "forms cyclic lactam bond, via epsilon-NH2, with C -terminal COOH"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human immunodeficiency virus; PND; cyclic; conjugate; AIDS; ARC; vaccine; immunogen; ELISA; analysis; cPND30.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "forms cyclic amide bond with epsilon- NH2 of
                                                                                                                                                                                                                                                                                             Conjugate proteins comprising HIV peptide components - useful for preparing vaccines for e.g. AIDS or for treating infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                predictation. The invention also describes (a) immunogenic protein fragments or peptides (I) derived from R11; (b) isolated DNA (II) encoding a protein (III) with the immunogenic properties of R11, and its encoding a protein (III) with the immunogenic properties of R11, and its fragments; (c) recombinant DNA that includes (II); and (d) antibodies (h) directed against R11 or (I). The products of the invention have anticancer activity and induce specific cellular or humoral immune response against cancer calls. R11, or derived immunogenic peptides and (recombinant) nucleic acid encoding them, are used for in vitro or in vivo immunotherapy of cancers. Cells that express R11 are used for in cancer vaccines and antibodies (Ab) that recognize R11 are used for treatment (e.g. when coupled to a cytostatic agent or radioisotope), diagnosis or monitoring of cancers associated with expression of R11 (parived peptides can also be used for diagnosis, e.g. to assess the immune response to vaccination or for prognosis of tumors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "forms amide bond with epsilon-amino of \mathrm{Lys}\left(2\right) to give cyclic molecule"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             note= "epsilon-amino group is condensed with C-terminal
                                                                                                                                                                        New tumor-associated antigen R11, useful for immunotherapy of tumors and for diagnosis, e.g. to assess the immune response to Vaccination or for

The invention relates to a conjugate of an HIV principal neutralizing determinant (PND), or an immunologically equivalent peptide (PEP), covalently coupled to an immunogenic protein or protein complex through an anionic polysaccharide linker. Pref. the immunogenic protein is the outer membrane protein complex (OMPC) of Naisseria meningitidis b and the PND peptide has a linear structure, a disulphide-bonded cyclic structure, an amide-bonded cyclic structure. The present sequence (CPND30) is an example of a PND peptide component. The present sequence (CPND30) is an example of a PND peptide component. The conjugates are used for inducing HIV-neutralising antibodies or for making vaccines to prevent contraction of HIV infection or disease. The antibodies can be used for passively protecting against infection by HIV, treating AIDS, or in diagnostic assays
                                                                                                                                                                                                                                             HIV peptide-polysaccharide-protein conjugates - used in vaccines or to produce antibodies to prevent or treat HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                C6 human sFv antibody C6.5 variable light chain CDR3 mutant C6ML3-17.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                      The peptide (cPND30) is a specifically claimed example of HIV principal neutralizing determinant peptides which are covered generically in Claims 1-3 (AAR311291, AAR31292), the peptides being stably cyclised as a result of a lactam bridge between an NH2 on the N-terminal side of the loop amino acids and a COOH on the C-terminal side of the loop amino acids. The bond is less labile than a disulphide bond. The stable cyclic HIV PND peptides (cPND's) may be used a analytical tools and as reagents in protein and/or a polysaccharide; e.g. PRP or OMFC) to give a product useful for inducing mammalian anti-peptide, anti-HIV, or HIV-neutralizing immune responses and for formulating vaccines to prevent HIV disease, including AIDS and ARC, or for tracting humans afflicted with HIV disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The present sequence represents a variable light chain CDR3 mutant C6ML3-

16 modified from the derived light chain variable region of the C6 human

17 continuous C6.5. The mutant C6ML3-16 specifically binds to c-erbB-2. A

18 chimeric molecule that binds specifically to tumour cells carrying c-erb

18 consists of an effector compound attached to a C6 human antibody. If

20 consists of an effector compound attached to a C6 human antibody. If

21 consists of an effector compound is a cytotoxin the chimeric molecule can be used to

22 carcinomas). If the effector compound is a label the chimeric molecule

23 carcinomas. If the effector compound is a label the chimeric molecule

24 carcinomas. If the effector compound is a label the chimeric molecule

25 carcinomas also be used for diagnosis/localisation. The

26 antibody can also be used for diagnosis/localisation, in vivo or in

27 vitro, especially by immunoassay. The mucleic acid encoding the antibody,

28 and a nucleic acid encoding a single chain polypeptide with the binding

26 specificity of the antibody and comprising the binding portions of light and heavy chains of the antibody, joined by a

27 linker, can be used to produce recombinant proteins by standard methods.

28 chould elicit little, if any, immunogenic response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel synthetic or recombinant polypeptide useful for promoting, reducing proliferation and/or migration of endothelial cells, and for modulating angiogenesis, has endothelial cell binding protein sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          endothelial cell binding protein; ECBP; anti-tumour; cytostatic; vasotropic; antipsoriatic; dermatological; ophthalmological; antidiabetic; antiarthritic; vulnerary; antiulcer; antinflammatory; antibacterial; gynaecological; angiogenesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADC44682;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ADC44682
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                         The present sequence represents a variable light chain CDR3 mutant C6ML3-
The modified from the derived light chain variable region of the C6 human antibody C6.5. The mutant C6ML3-17 specifically binds to c-erbb-2. A chimeric molecule that binds specifically to tumour cells carrying c-erbb compound is a cyttocxin the chimeric molecule can be used to inhibit growth of c-erbb-2 positive tumours (especially breast and other carcinomas). If the effector compound is a label the chimeric molecule can be used to detect such cells, including in vivo localisation. The antibody can also be used for disgnosis/localisation, in vivo or in viro, especially by immunoassay. The nucleic acid encoding the antibody and comprising the binding portions of specificity of the antibody and comprising the binding portions of uniable regions of light and heavy chains of the antibody, joined by a linker, can be used to produce recombinant proteins by standard methods. Unlike known anti-c-erbb-2 antibodies, C6 antibodies are fully human, so should elicit little, if any, immunogenic response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               7
```

The invention relates to a novel isolated, synthetic or recombinant peptide or polypeptide which includes one or more endothelial cell binding protein (ERBP) sequences. A peptide of the invention has antitumour, cytostatic, vasotropic, antipsoriatic, dermatological, ophthalmological, antidiabetic, antiarthritic, vulnerary, antiulcer,

antinflammatory, antibacterial, and gynaecological activity. The peptide is useful for promoting, reducing the proliferation and/or migration of endothelial cells, by treating the cells with an BCBP agonist, which is preferably the peptide, to promote proliferation and/or migration of the treated cells, and for reducing or promoting angiogenesis, by treating the cells with an BCBP antagonist, which is preferably the peptide of the invention. A peptide of the invention is also useful for manufacturing a medicament for promoting angiogenesis, by admixing an BCBP antagonist to promote or reduce angiogenesis at one or more sites in a treated mammal. The medicament is useful for promoting or reducing angiogenesis. BCBP sequences are useful to alter the infectivity spectrum of a viral particle. The present sequence represents an ECBP of the invention.

## ALIGNMENTS

```
This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     G-protein coupled receptor; cardiovascular disease; arrhythmia; myocardial infarction; congestive heart failure; cardiomyopathy; atherosclerosis; arrentosclerosis; embolism; angina; thrombosis; hypertension; Alzheimer's disease; Parkinson's disease; osteoporosis; bypertension; Alzheimer's disease; parkinson's disease; osteoporosis; obesity; human immunodeficiency virus infection; HIV; schizophrenia; sleeplessness; acquired immunodeficiency syndrome; AIDS; leukaemia; sepsis; inflammation; psoriasis; Gaucher's disease; ischaemia.

The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to an isolated polypeptide (ustyleter) which has a G-protein coupled receptor (GPCR) activity (also known as CPCR74 or GPCR81) and is encoded by the CDNA contained in ATCC Deposit Number PTA-2766, its variants (HGPRBMY111V1 and HGPRBMY11V2), fragments, domains, species homologues and proteins 95% similar to it. Also including are: (1) the nucleic acids encoding the HGPRBMY11 proteins (including covariants, fragments, complements and sequences 95% similar to the HGPRBMY11 nucleic acids); (2) recombinant vectors; (3) transformed host collise expressing HGPRBMY11; (4) an anti-HGPRBMY11 antibody; (5) diagnosing a pathological condition in a subject; (6) identifying an activity in a biological assay; (8) a process for making polymucleotide sequences encoding a gene product condition in a subject; (6) identifying an activity in a biological assay; (8) a process for making polymucleotide sequences encoding a gene product condition and altered GPCR activity; (9) a shuffled polymucleotide produced by the method of (8); and (10) screening for candidate compounds capable of binding to and/or modulating activity of a GPCR. The polympclate or the polymucleotide is useful for preventing, treating or ameliorating a medical condition, particularly cardiovascular diseases or disorders.

CC cardiomypathy, atheresoiles, arteriosclerosis, embolism, angina, cradiomypathy, pathoresoiles, arteriosclerosis, embolism, angina, immunodeficiency syndrome (AIDS), leukaemia, sepsis, cradiomypathy, polypeptide or polymucleotide immunodeficiency syndrome (AIDS), leukaemia, sepsis, cradiomypathy, polypeptide, polymucleotide are listed in t The invention relates to an isolated polypeptide (designated HGPRBMX11), Disclosure; Page 48; 444pp; English.

The invention relates to an isolated polypeptide (designated HGPRBWY11), which has a G-protein coupled receptor (GPCR) activity (also known as GPCRV4 or GPCRB1) and is encoded by the CDNA contained in ArC Deposit CC Mumber PTA-2766, its variants (HGPRBWY11v1 and HGPRBWY11v2), fragments, commains, species homologues and proteins 55% similar to it. Also included are: (1) the nucleic acids encoding the HGPRBWY11 proteins (including variants, fragments, complements and sequences 95% similar to the HGPRBWY11 nucleic acids); (2) recombinant vectors; (3) transformed host calls expressing HGPRBWX11; (4) an anti-HGPRBWY11 antibody; (5) diagnosing a pathological condition on a subject; (6) identifying an activity in a biological assay; (8) a process for making polymucleotide sequences encoding a gene product condition in a subject; (6) identifying an activity in a biological assay; (8) a process for making polymucleotide sequences encoding a gene product having altered GPCR activity; (9) a shuffled polymucleotide product chaving altered GPCR activity; (9) a shuffled polymucleotide product condition, particularly cardiovascular diseases or disorders, cardiovascular infarction, congestive heart failure, arrhythmias, cardiovopathy, atherosclerosis, arteriosclerosis, embolism, angina, thrombosis or hypertension). The HGPRBWY11 polypeptide or polymucleotide is also useful for treating, preventing or ameliorating e.g. Alzheimer's cardiovopsathy, sporiassis, gardiorascis, observity human immunodeficiency virus (HrV) infections, schizophrenia, sepsis, acquired immunodeficiency syndrome (AIDS), leukaemia, sepsis, cimflammantions, poriassis, gaucher's disease, osteoporosis (manamations, poriassis, gaucher's disease, osteoporosis, observity in the specification). The present (chiseases and disorders are listed in the specification). The present (chiseases and disorders are listed in the specification). The present (chiseases and disorders are listed in the specification). The present (chiseases and disorders are listed in the speci New human G-protein coupled receptor HGPREMY11 polypeptide or polynuclectide, useful for preventing, treating or ameliorating e.g. myocardial infarction, angina, thrombosis, Alzheimer's disease, Barber LE; Cacace AM, Disclosure; Page 76; 444pp; English. Ramanathan C, (BRIM ) BRISTOL-MYERS SQUIBB CO. schizophrenia, AIDS, leukemia. 16-JUL-2001; 2001US-0305818P. Nelson TC, WPI; 2003-093137/08. Feder J,

                                                                                                                                                                                                                                                                                                                                                                                                                                polymorphic variants of proteins (AAG98010-AAG99238) related to angiopoletin, 4-hydroxybutyrate, dehydrogenase, adenosine triphosphate (ATP)-dependent RNA helicase, major histocompatibility complex (WHC) Class I histocompatibility antigen and/or phosphoglycerate kinase. These nucleic acid single nuclectide polymorphisms (SNRs) and the encoded proteins have potential immunosuppressive, immunostimulatory, antisclerotic, antidiabetic, antimilammatory, cytostatic, antileukemic, neuroprotective and antimicrobial activity and may be useful in gene/protein therapy, vaccines, modulation of the expression and activity of proteins related to angiopoletin, 4-hydroxybutyrate, dehydrogenase, adenosine triphosphate (ATP)-dependent RNA helicase, major histocompatibility complex (MHC) class I histocompatibility antigen and/or phosphoglycerate kinase. Disorders that may be prevented, diagnosed and/or treated by the above methods include multifactorial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 7
```

```
methylation recognises proteins which have a proline residue at position 4 (e.g., the bacterial ribosomal protein L16 and the bacterial chemotaxis protein Che2). The method comprises introducing mutations into the DNA reducing the protein so that residue 4 a non-proline residue, thereby reducing the degree of N-terminal methylation when the protein is expressed in a bacterium. The method is useful for decreasing methylation of a protein, particularly a recombinantly produced protein. The demethylated protein can be used in a pharmaceutical composition for the treatment of a disease but with less likelihood of eliciting an immunological response. These demethylated proteins may be used as symptoms associated with a disease. The exemplifications describe the expression of a recombinant human haemoglobin construct (FEBL:1) in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Escherichia coli, and its modification such that residue 4 of the di-
alpha chain of the recombinant haemoglobin is altered from proline to a
non-proline residue. The present sequence represents a peptide referred
to in the disclosure of the invention. (Updated on 06-AUG-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; secreted protein; fusion protein; gene therapy; protein therapy; diagnosis; tissue; cancer; tumour; neurodegenerative disorder; leukaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Decreasing methylation of an N-terminus protein, especially hemoglobin having proline at amino acid position 4, useful for producing demethylated proteins for treating diseases, by altering this amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of decreasing the amount of N-terminal methionine methylation on a protein expressed in a bacterium. The bacterial methyltransferase which directs N-terminal methionine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ·

This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAXO4302) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 86 novel genes and their fragments (nucleic acid sequences: AAXO4311.X04410; amino acid sequences AAW78126-W78225) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, Yu G, Ni J; New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders. ```
human immunodeficiency virus-1 (HIV-1) group comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABR25397). (1) has virucide activity and can be used in vaccines. (1) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigions in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or cumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups, achieving, for example, enhanced as compine escapes of an group-based vaccine approach is the association of the groups, achieving, for example, enhanced in munogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response
                                                                                                                                                                                                     oʻ
pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 86 polynucleotides, based on which tissues they are most highly expressed in (see AAX04311 for described uses)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu;

(I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccines for antigens is directed largely toward variable response to whole antigens is directed largely toward variable response to whole antigens is directed largely toward variable response to whole antopens is directed largely toward variable response to whole antopens is directed largely toward variable response to whole antopens are seasoned argued to the composition of the group be selected from conserved regions of viral or unnour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response consists is not possible with traditional approaches. ABPI1501 to ABP25412 represent

additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid agequence selected from 51 defined amino acid sequences selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigen is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based was chiral to the actine and the antigens of the antigens can be avoided with the use of group-based was chiral to the actine and the actine and antigens are actines. The actine and are actines the actine and antigens can be avoided with the use of group-based was calmes. Saffran DC, Afar DEH; -Eid PM, Faris M, S; Ge W, Jakobovits A; Challita-Eid PM, 17-AUG-2000; 2000US-0226329P. Hubert RS,

Monitoring 83P2H3 gene products for monitoring the presence of cancer in a subject, comprises determining the status of 83P2H3 gene products in a tissue sample from the subject and comparing it to a normal sample.

Example 11; Page 179; 270pp; English.

The Invention relates to monitoring 83P2H3 (a calcium transport protein whose gene is located on chromosome 7434) gene products in a biological cample from a patient who has or is suspected of having cancer of 83P2H3 gene products expressed by cells in a tissue sample from an products expressed by cells in a tissue sample from an products expressed by cells in a tissue sample from an products in a normal sample. Also included are modulators of 83P2H3 gene function or status, generating antibodies/immune response against 83P2H3 or related protein CaTrP2B11 whose gene is located on chromosome derived from the protein, delivering a cytotoxic agent to a cell cariored from the protein, delivering a cytotoxic agent to a cell expressing 83P2H3 by conjugating the agent to a natti-83P2H3 antibody, a crecombinant protein comprising an antigen-binding region of the antibody, and non-clonal antibody that comprises the variable domains of the heavy and connected that encodes the recombinant protein, a single-chain of light chains of the anti-83P2H3 antibody, a vector comprising an expense of a 83P2H3 protein, by providing a 83P2H3-related comprises a T cell or B cell epitope, and contacting the protein that comprises a T cell or B cell epitope, and contacting the ceptiope with an immune system T cell or B cell epitope, and contacting the ceptiope with an immune system T cell or B cell epitope, and contacting the monitoring the presence of cancer in an individual. The modulator is cuseful for inhibiting the growth of cancer cells that express 83P2H3, for treating cancer and the vector is useful for treating a patient with a The invention relates to monitoring 83P2H3 (a calcium transport protein

The invention relates to monitoring 83P2H3 (a calcium transport protein whose gene is located on chromosome 7q34) gene products in a biological sample from a patient who has or is suspected of having cancer (especially prostate cancer), comprises: (a) determining the status of 83P2H3 gene products expressed by cells in a tissue sample from an individual and (b) comparing the status to the status of 83P2H3 gene products in a normal sample. Also included are modulators of 83P2H3 function or status, generating antibodies/immune response against 83P2H3 (or related protein Calf2Ell whose gene is located on chromosome 12q24.1) using identified HLA (human leukocyte antigen) binding peptides

Example 11; Page 186; 270pp; English.

derived from the protein, delivering a cytotoxic agent to a cell expressing 83P2H3 by conjugating the agent to an anti-63P2H3 antibody, a recombinant protein comprising an antigen-binding region of the antibody,

cancer that expresses 83P2H3. The immunological methods are useful for presence of 83P2H3.related protein or polynuclectide in a biological sample from a patient who has or who is suspected of having cancer. The methodologies and treatment, to detect and quantify 83P2H3 and mutant isolating broteins, for purifying a 83P2H3-related protein, for idiotypic antibodies that mimic the 83P2H3 related protein, for idiotypic antibodies that mimic the 83P2H3 rotein. The present sequence and individual protein and is an HLA binding peptide motif from 83P2H3 protein. The present sequence and minicipal protein and its related protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Monitoring 83P2H3 gene products for monitoring the presence of cancer in a subject, comprises determining the status of 83P2H3 gene products in a tissue sample from the subject and comparing it to a normal sample.
                                                                                                                                                                                                                                  Gaps

pybridoma that produces the recombinant produces in recomminant produces the recombinant party of the produces the recombinant party of the heavy and monoclonal antibody that comprises the variable domains of the heavy and monoclonal antibody that comprises the variable domains of the heavy and induction of the anti-83p2H3 antibody, a vector comprising a colymucleotide that encodes the monoclonal antibody and inducing an immune response to a 83p2H3 protein, by providing a 83p2H3-related protein that comprises a T cell or B cell epitope, and contacting the presence of cancer in an individual. The method is useful for monitoring 83p2H3 gene products in a biological sample for monitoring the growth of cancer cells that express 83p2H3, for useful for inhibiting the growth of cancer cells that express 83p2H3, for treating an expenses 83p2H3. The immunological methods are useful for cancer that expresses 83p2H3. The immunological methods are useful for generating an immune response against 83p2H3, and for detecting the greence of 83p2H3. The immunological methods are useful for sample from a patient who has or who is suspected of having cancer. The sample from a patient who has or who is suspected of having cancer. The antibody is useful in prostate cancer diagnosis, prognosis, imaging methodologies and treatment, to detect and quantify 83P2H3 and mutant 83P2H3-related proteins, for purifying a 83P2H3-related protein, for isolating 83P2H3 homologues/related molecules, and for generating antidiotypic antibodies that minic the 83P2H3 protein. The present sequence is an HIA binding peptide motif from 83P2H3 or its related protein non-human transgenic animal that produces the recombinant protein, a

Monitoring 83P2H3 gene products for monitoring the presence of cancer in a subject, comprises determining the status of 83P2H3 gene products in a tissue sample from the subject and comparing it to a normal sample.

Example 11; Page 194; 270pp; English.

The invention relates to monitoring 83P2H3 (a calcium transport protein

whose gene is located on chromosome 7q34) gene products in a biological sample from a patient who has or is suspected of having cancer cample from a patient who has or is suspected of having cancer (specially prostate cancer), comprises: (a) determining the status of 3322H3 gene products expressed by cells in a tissue sample from an idial products expressed by cells in a tissue sample from an individual and (b) comparing the status of the status of 3322H3 gene products in a normal sample. Also included are modulators of 332H3 gene function or status, generating antibodies/immune response against 332H3 cuncil deal ved from the protein (aprivation and status) and status antigen by binding peptides (cor related protein (aprivation delivering a cytotoxic agent to a cell derived from the protein, delivering an antigen-binding region of the antibody, a non-human transgenic animal that produces the recombinant protein, a single-chain of the antibody that comprises the variable domains of the heavy and conclonal antibody that comprises the variable domains of the heavy and conclonal antibody that comprises a real of single-chain of the anti-332H3 protein, by providing a 832H3. The monoclonal antibody and inducing an immune response to a 832H3 protein, by providing a 832H3. The method contacting the protein expresses 812H3 protein, by providing a biological sample for inhibiting the growth of cancer relate expresses 832H3. The immunological methods are useful for inhibiting the growth of cancer cells that express 832H3. For treating cancer and the vector is useful for treating and expresses 832H3. The immunological methods are useful for cancer that expresses 832H3. The immunological methods are useful for sample from a patient who has or who is suspected of having and example of sample from a patient who has or who is suspected of having and example from a patient who has or who is suspected of having and example from a patient who has or who is suspected of having and example from a patient who has or who is suspected · 0 Gaps ·; 2; Indels Length 9; Score 25; DB 5; I Pred. (EPIM-) EPIMMUNE INC

```
The present invention describes a composition (I) comprising a prepared human immundeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (RBL55347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole altigens is directed largely toward variable regions of the antigen, an group-based vaccine may be selected from conserved regions of viral or an group-based vaccine may be selected from conserved regions of viral or encorate mannariants.
                                                                                                                                                                                                                                                                                                                                                                                                                       escape mutants. Furthermore, immunosuppressive groups that may be present and whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABPILSOI to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.
                                                                                                          compositions comprising human immunodeficiency virus-1 (HIV-1) groups, useful for vaccinating against {\rm HIV}-1.

Compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, antigens is directed largely toward variable regions of the antigen, allowing for immune scape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABPIISOI to ABPES412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

                                                                                                                                                            The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL2547 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines particularly when compared to the use of whole antigens in vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.

                                                                                                          the present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of the scape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to comboine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced in minoconfictive the content of the groups achieving, for example, when can be avoided with the vector of composition of the groups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nephrotropic kidney response-associated protein isoform; gene therapy; antisense therapy; kidney function; tubular nephritis; renal failure; nephron cell metabolic pathway modulation; glomerular necrosis;
                              Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against {\rm HIV}{-1}.

The invention relates to a novel method for the screening, diagnosis or prognosis of kidney response (KR). The method of the invention has nephrotropic activity, and may have a use in gene therapy or antisense therapy. The method is useful for the screening, diagnosis or prognosis of KR in a subject, for determining the stage or severity of KR in a subject, for identifying a subject at risk of developing KR, or for antisense continuing the effect of therapy administered to a subject with KR. An alternative method of the invention is useful for screening agents that interact with one or more of the kidney response-associated protein is osoforms (KRPIS). The kidney response includes alterations in kidney function, any phase of nephron cell metabolic pathway modulation, glomerular/proximal tubular nephritis, glomerular/papillary necrosis, caute and chronic renal failure, and end stage renal disease. The sequences shown in ABB61314-ABB61787 represent tryptic digest peptides of the KRPIS of the invention

protein complex is a regulatory protein, which regulates the specificity of the channel forming protein for nucleic acid transport. Human cytosolic malate dehydrogenase (cMDH; AMA7750) was used as the second subunit protein in the invention. The protein complex is useful for reducing nucleic acid toxicity in kidney cells, and for facilitating the transport of nucleic acids into cells for a number of therapeutic applications. The present sequence is a p36 tryptic peptide, which was used in a sequence homology alignment with cMDH (given in Figure 3)

Facilitating production of a protein for analyzing, designing and/or modifying an agent that can interact with a viral F protein, comprises expressing a nucleic acid optimized for expression of the protein, using a eukaryctic cell.

Claim 42; Page 100; 367pp; English

protein or its derivative from a motative actualing production to protein or its derivative from a modelic acid molecule encoding the protein in a host cell, where the nucleic acid is optimised for expression by a cukaryotic cell, where the nucleic acid is optimised for expression by a cukaryotic cell. The protein, especially F protein by a seeful for analysing, designing and/or modifying an agent capable of interacting with a viral F protein or its derivative and modulating a functional activity associated with the protein. By contacting the protein with a cutivity associated with the protein. An optimised nucleic acid or its derivative, equivalent, analogue or mimetic is useful for interacting with a viral F protein and modulating a functional activity associated with the viral contein and modulating a functional activity associated with the viral contein with a negative sense single stranded RNA virus, and for modulating a functional activity associated with a viral F protein in a modulating a functional activity associated with a viral F protein in a The invention relates to a method for facilitating production of a 

protein or its derivative from a negative sense single stranded RNA virus, by expressing a nucleic acid molecule encoding the protein in a host cell, where the nucleic acid is optimised for expression by a eukaryotic cell. The protein, especially P protein, is useful for analyzing, designing and/or modifying an agent capable of interacting with a viral F protein or its derivative and modulating a functional activity associated with the protein, by contacting the protein with a putative agent and assessing the degree of interactive complementarity of the agent with the protein. An optimised nucleic acid or its derivative, equivalent, analogue or mimetic is useful for interacting with a viral F protein and modulating a functional activity associated with the viral F protein and modulating a functional activity associated with the viral F protein.

protein, for use in the manufacture of a medicament utilised in the therapeutic and/or prophylactic treatment of conditions characterised by infection with a negative sense single stranded RNA virus, and for modulating a functional activity associated with a viral F protein in a

subject, preferably a mammal, especially a human, where the functional activity is F protein mediated host cell virion fusion and/or virion budding and the modulating is down regulation. Sequences ABG98514-ABG99058 represent F protein decapeptides of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to monitoring 83P2H3 (a calcium transport protein whose gene is located on chromosome 7q34) gene products in a biological cample from a patient who has or is suspected of having cancer (especially prostate cancer), comprises: (a) determining the status of 83P2H3 gene products expressed by cells in a tissue sample from an individual and (b) comparing the status to the status of 83P2H3 gene conversion or status, generating antibodies/immune response against 83P2H3 throtion or status, generating antibodies/immune response against 83P2H3 cunction or status, generating antibodies/immune response against 83P2H3 current and for the form the protein, delivering a cytotoxic agent to a cell carrent protein comprising an antigen-binding region of the antibody, a recombinant protein comprising an antigen-binding region of the antibody and con-human transgenic animal that produces the recombinant protein, a single-chain of the anti-83P2H3 antibody, a vector comprising an con-human transgenic animal that produces the recombinant protein, a single-chain of the anti-83P2H3 protein, a single-chain comprises the anti-83P2H3 antibody, a vector comprising and inducing an immune response to a 83P2H3 protein, by providing a 83P2H3-related conformation and immune system T cell or B cell, respectively. The method conforming the presence of cancer in an individual. The modulator is monitoring the presence of cancer in an individual. The modulator is cuseful for inhibiting the growth of cancer cells that express 83P2H3, for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to monitoring 83P2H3 (a calcium transport protein whose gene is located on chromosome 7q34) gene products in a biological sample from a patient who has or is suspected of having cancer (especially prostate cancer), comprises: (a) determining the status of B19P4H3 gene products expressed by cells in a tissue sample from an individual and (b) comparing the status to the status of 83P2H3 gene products in a normal sample. Also included are modulators of 83P2H3 function or status, generating antibodies/immune response against 83P2H3 (or related protein GATFFEH1 whose gene is located on chromosome 12q24.1) using identified HLA (human leukocyte antigen) binding peptides derived from the protein, delivering a cytotoxic agent to a cell expressing 83P2H3 by conjugating the agent to an anti-83P2H3 antibody, a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Monitoring 83P2H3 gene products for monitoring the presence of cancer in a subject, comprises determining the status of 83P2H3 gene products in a tissue sample from the subject and comparing it to a normal sample.
treating cancer and the vector is useful for treating a patient with a cancer that expresses 83P2H3. The immunological methods are useful for generating an immune response against 83P2H3, and for detecting the presence of 83P2H3-related protein or polynucleotide in a biological sample from a patient who has or who is suspected of having cancer. The antibody is useful in prostate cancer diagnosis, prognosis, imaging methodologies and treatment, to detect and quantify 83P2H3 and mutant $83P2H3 cancer and quantify 83P2H3 and mutant isolating $3P2H3 homologues/related molecules, and for generating antidiotypic antibodies that mimic the $3P2H3 protein. The present sequence is an HLA binding peptide motif from $3P2H3 or its related protein

recombinant protein comprising an antigen-binding region of the antibody, a non-human transgenic animal that produces the recombinant protein, a hybridoma that produces the recombinant protein, a single—chain monoclonal antibody that comprises the variable domains of the heavy and light chains of the anti-83P2H3 antibody, a vector comprising a polynucleotide that encodes the monoclonal antibody and inducing an immune response to a 83P2H3 protein, by providing a 83P2H3-related protein that comprises a T cell or B cell epitope, and contexting the epitope with an immune system T cell or B cell, respectively. The method is useful for monitoring 83P2H3 gene products in a biological sample for monitoring the presence of cancer in an individual. The modulator is useful for inhibiting the growth of cancer cells that express 83P2H3, for reasting cancer and the vector is useful for treating a patient with a cancer that express 83P2H3, for treating a patient with a cancer that expresses 83P2H3. The immunological methods are useful for generating an immune response against 83P2H3, and for detecting the presence of 83P2H3-related protein or polynucleotide in a biological sample from a patient who has or who is suspected of having cancer. The antibody is useful in prostate cancer diagnosis, prognosis, imaging enchodologies and treatment, to detect and quantify 83P2H3 and mutant 83P2H3-related proteins, for purifying a 83P2H3-related protein, for isolating 83P2H3 nonologues/related molecules, and for generating anticitotypic antibodies that mimic the 83P2H3 protein. The present sequence is an HLA binding peptide motif from 83P2H3 or its related protein CaTrF2E11

Monitoring 83P2H3 gene products for monitoring the presence of cancer in a subject, comprises determining the status of 83P2H3 gene products in a tissue sample from the subject and comparing it to a normal sample.

Example 11; Page 182; 270pp; English

The invention relates to monitoring 83P2H3 (a calcium transport protein whose gene is located on chromosome 7q34) gene products in a biological sample from a patient who has or is suspected of having cancer (sepecially prostate cancer), comprises: (a) determining the status of 83P2H3 gene products saxpressed by cells in a tissue sample from an order of saxple. Also included are modulators of 83P2H3 gene products an anormal sample. Also included are modulators of 83P2H3 gene products an anormal sample. Also included are modulators of 83P2H3 gene products agenesting antibodies/immune response against 83P2H3 tunction or status, generating antibodies/immune response against 83P2H3 correcting dentified HLA (human leukocyte antigen) binding peptides derived from the protein, delivering a cytocoxic agent to a cell cypessing 83P2H3 by conjugating the agent to an anti-83P2H3 antibody, a recombinant protein, a single chain ordering an antigen-binding region of the antibody, a non-human transgenic animal that produces the recombinant protein, a single chain of the anti-83P2H3 antibody, a vector comprising an ordering an immune response to a 39P2H3 protein, by providing a 83P2H3 exclain, by providing a 83P2H3. Frelated protein, by providing a 83P2H3. Frelated comprises a T cell or B cell, respectively. The method is useful for minitoring the presence of cancer in an individual. The modulator is useful for inhibiting the growth of cancer cells that expresses 83P2H3. The immunological methods are useful for sensing an immune response against 83P2H3, and for detecting the presence of an error pensenting an immune response against supperted of having cancer. The sample from a patient who has or who is suspected of having cent, in prostate cancer diagnosis, prognosis, imaging methodologies and treatment, to detect and guantify 83P2H3 and mutent sapples cancer diagnosis, prognosis, imaging method is useful for purifying 83P2H3-related proteins, for purifying 83P3H3-related proteins, for purifying 83P3H3-related proteins, for pur isolating 83P2H3 homologues/related molecules, and for generating antidiotypic antibodies that mimic the 83P2H3 protein. The present sequence is an HLA binding peptide motif from 83P2H3 or its related protein

The invention relates to monitoring 83P2H3 (a calcium transport protein whose gene is located on chromosome 7q34) gene products in a biological cample from a patient who has or is suspected chaving cancer (especially prostate cancer) comprises: (a) determining the status of 1872H3 gene products expressed by cells in a tissue sample from an individual and (b) comparing the status to the status of 83P2H3 gene products in a normal sample. Also included are modulators of 83P2H3 gene products in a normal sample. Also included are modulators of 83P2H3 correction or status, generating antibodies/immune response against 83P2H3 (c) related protein CaTrEZEII whose gene is located on chromosome comprising an authory to an anti-83P2H3 antibody, a crecombinant protein comprising an authory expressing 83P2H3 by conjugating the agent to an anti-83P2H3 antibody, a recombinant protein comprising an authories. The recombinant protein, a hybridom that produces the recombinant protein, a hybridom a natibody that comprises the variable domains of the heavy and conclonal antibody that comprises the variable domains of the heavy and protein that comprises a T cell or B cell, respectively. The method is useful for monitoring 83P2H3 protein, by providing a 83P2H3-related protein that comprises a T cell or B cell, respectively. The method is useful for inhibiting the ground relation and the vector is useful for monitoring 83P2H3 gene products in a biological sample for monitoring the presence of cancer in an individual. The modulator is cancer that expresses 83P2H3 protein, cancer cells that express 83P2H3 for cancer that expresses 83P2H3, for cancer that expresses 83P2H3, protein, cancer method are useful for cancer and the vector is useful for resetting cancer and the vector is useful for resetting a patient with a cancer in a influence of cancer in an individual. The medulator is the cancer in a manual context of the cancer and the vector is useful for resetting a patient with a cancer in a product of the cancer in an individual and 
                                                                                                                                                            Monitoring 83P2H3 gene products for monitoring the presence of cancer in a subject, comprises determining the status of 83P2H3 gene products in a tissue sample from the subject and comparing it to a normal sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               isolating 83P2H3 homologues/related molecules, and for generating antidiotypic antibodies that mimic the 83P2H3 protein. The present sequencis an HLA binding peptide motif from 83P2H3 or its related protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antibody is useful in prostate cancer diagnosis, prognosis, imaging methodologies and treatment, to detect and quantify 83P2H3 and mutant 83P2H3-related proteins, for purifying a 83P2H3-related protein, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   generating an immune response against 83P2H3, and for detecting the presence of 83P2H3-related protein or polynucleotide in a biological sample from a patient who has or who is suspected of having cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          vasotropic; antipsoriatīc; dermatological; ophthalmological; antidiabetic; antiarthritic; vulnerary; antiulcer; antinflammatory;

The invention relates to a novel isolated, synthetic or recombinant peptide or polypeptide which includes one or more endothelial cell binding protein (ECBP) sequences. A peptide of the invention has antitumous, cytostatic, vasotropic, antipaciatic, dermatological, antidiabetic, antiarthritic, dermatological, antidiabetic, antiarthritic, vulnerary, antiulcer, ophthalmological, antidiabetic, antiarthritic, vulnerary, antiulcer, antiinflammatory, antibacterial, and gynaecological activity. The peptide candiothelial cells, by treating the proliferation and/or migration of preferably the peptide, to promote proliferation and/or migration of the preferably the peptide, to promote proliferation and/or migration of the created cells, and for reducing or promoting angiogenesis, by treating the cells with an ECBP antagonist, which is preferably the peptide of the invention is also useful for manufacturing a medicament for promoting angiogenesis at one or more sites in a treated mammal. The medicament is useful for promoting or reducing angiogenesis. ECBP sequences are useful to alter the infectivity spectrum of a viral particle. The present sequence represents an ECBP of the
                                                                                                                                                                                                                                                                                                   Novel synthetic or recombinant polypeptide useful for promoting, reducing proliferation and/or migration of endothelial cells, and for modulating angiogenesis, has endothelial cell binding protein sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAR79121 and AAR79122 are possible N-terminal peptides from a new algal lectin which are derived from the Bucheuma species of alga. More specifically the lectin is derived from either E.serra, E.cottonii, E.gelatinae or E.amakusaensis. The N-terminal peptides obey the general formula G-R-Y-T-V-X-N-Q-W-G where X= Q or K. The lectins have a unique ability to bind specifically to certain sugar-chains, and bind specifically to certain sugar-chains, and bind lectin may be used in a variety of ways; as an immunomodulator, as a diagnostic and test reagent, as a specific adsorbent for separation and analysis of sugars, as an organ transplant rejection inhibitor, as an analysis of sugars, as an organ transplant rejection inhibitor, as an anticancer agent, for the treatment of autoimmune disease and as a lymphocyte growth factor. (Updated on 27-AUG-2003 to correct OS field.)
               The present invention relates to peptides (AAB38648-B38970) comprising a first conformationally constrained portion with a cross-linked group of a HIV envelope protein that induces neutralising antibodies, and a second portion comprising a continuous stretch of at least 5 amino acids having a predicted secondary structure. The present sequence is one such peptides of the present invention are useful as a vaccine for prophylactic or therapeutic treatment of a mammal for HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Algal lectin with unique sugar-chain binding specificity - deriv.from Eucheuma or Kappaphycus species, is useful for diagnosis and therapy of cancer and immune disorders.

The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hydrophilic; signal oligopeptide; hydrophilicity maxima; vaccine; SIV; competitive inhibitor; feedback regulator; synthesis; gastrin precursor; charge; polarity; farnesyl synthetase; plasminogen activator inhibitor 1; hydroxymethylgilutaryl coenzyme A reductase; glucagon precursor; rhesus; gonadoliberin precursor; plasminogen activator inhibitor 2; prorenin; Alzheimer amyloid A4; corticotropin releasing factor binding protein; apolipoprotein E; herpes virus 1 glycoprotein B; HSV1; human; OMVVS; herpes virus 2 glycoprotein B; HSV2; collagenase; apolipoprotein A; rreponem pallidum membrane protein; TMPA; islet amyloid polypeptide; fibroblast MMP1; schistosoma elastase precursor; schistosomin; hepatitis delta antigen; rev protein; HIV; VIIV; angiotensinogen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Escherichia coli was introduced into VA13 to obtain a cell intrusion E. coli. This was carried out using ESPEL. 22 clones were selected from this and plasmid extracted. DNA sequencing was carried out by Taq cycle sequencing. The invention concerns a fusion protein which presents at the surface of bacterial cells transformed with DNA coding for the fusion protein. Bacterial peptide library which is an aggregate of such bacterial peptide library which is an aggregate of such bacteria. The bacterial peptide library is useful in identification of target proteins having a desired blochemical activity in target cells, for diagnosis or treatment of diseases such as autoimmune diseases and cancer. The bacterial library readily reproduces and is relatively stable, without significant change or denaturation during preservation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bacterial peptide library expressing cell invasive protein on the cell surface - bonded to a random target protein which is thus introduced to

prevention, diagnosis and traction of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or tracted include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus arthritis, multiple sclerosis, diabetes, especial concers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms
                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, agiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines; interferons, interferons, interferons, incorpled receptors and thiscenses. The present sequence is a peptide encoded by one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the
                                                                                                                                                                                                                                                   Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5. .12
/note= "streptavidin-binding octapeptide fused to C-terminus of VL chain"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Streptavidin binding peptide; fusion protein; immunoglobulin; Ig; light chain variable region; affinity chromatography; purification;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAW21201-560 represent hydrophilic signal oligopeptides. These signal oligopeptides are localised on the surface of the protein and are represented by the hydrophilicity maxima of the protein. These peptides are enriched in charged amino acids arranged with neutral spacer amino acids. The specific signal character of these oligopeptides is determined by a characteristic combination of conformation and charge within the signal sequence. These oligopetides may be used as vaccines in the treatment of human disease, as competitive inhibitors to prevent or reduce the metabolic action or interaction of a selected protein by
                                                                                                                                                                                                                                                                                                                              Identifying signal oligopeptide(s) in protein sequence(s) - shown as regions of max. hydrophilicity, used in modulating communication between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              blocking its specific signal sequences, or as therapeutic agents to function as feedback regulators to reduce synthesis rate of a selected protein. These peptides may be modified by omitting one or more amino acids at the N- and/or C-terminal, by substituting one or more amino acids without consideration of charge and polarity, by substituting one or more amino acids with animo acid residues with similar charge and/or polarity, by omitting one or more amino acids with amino acids residues with similar charge and/or polarity, by omitting one or more amino acids or a combination of these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                            New fusion peptide(s) - have easily controlled binding properties and are capable of binding to streptavidin.
                                                                                                       Six derivatives of pASK46 (a plasmid for expression of the D1.3FV tragment in B.coll) were produced which encode 4 different peptides at the C-terminus of VL of the D1.3FV fragment. The peptides fused to the C-terminus are all examples of streptavidin-binding peptides corresponding to a generic formula (see AAK5.5698). The peptides do not interfere with the protein function but facilitate purification by conferring streptavidin-binding properties on

The present invention describes a method for screening or diagnosing ErbB2—related cancer. The method comprises generating ErbB2 oversypression features (EDFs) from test samples of body fluid from the subject by electrophoresis, and comparing the EDFs in the test sample. Also described: (1) an antibody capable of immunospecific binding to an ErbB2 oversypression protein isoform (EDF); (2) pharmaceutical compositions comprising an EOPI, a nucleic acid immunospecific binding to an ErbB2 oversypression protein isoform (EDF); (2) pharmaceutical compositions comprising an EOPI, a nucleic acid encoding an EOPI, an amount of the above antibody or its fragment, and a carrier; (3) a kit comprising one or more antibodies and/or EOPIs cited above, other reagents and instructions for use; (4) methods of treating above, other reagents and instructions for use; (5) methods of screening for or preventing ErbB2-related cancer; (5) methods of screening for or identifying agents that interact with or modulate the expression or activity of, one or more EDPIs, EDPI fragment, EDPI-related polypeptides, or EOPI-fusion proteins; (6) a method for modulating the activity of one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
Six derivatives of pASK46 (a plasmid for expression of the D1.3FV fragment in E.coli) were produced which encode 4 different peptides at the C-terminus of VH and 2 peptides at the C-terminus of VL of the D1.3FV fragment. The peptides fused to the C-terminus are all examples of streptavidin-binding peptides corresponding to a generic formula (see AAKSS698). The peptides do not interfere with the protein function but facilitate purification by conferring streptavidin-binding properties on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cancer, oncogene; ErbB2 overexpression-associated protein isoform; EOF; ErbB2 overexpression feature; cytostatic; vaccine;

or more of the ErbB2 EOPIs, comprising administering to a subject an agent identified by the method of (5); and (7) a method for identifying targets for therapeutic modulation of ErbB2-related cancer. BOPIS have cytostatic activity and can be used in vaccines and gene therapy. The method is useful in screening, diagnosing, preventing or treating ErbB2-related cancer, identifying a subject at risk of developing ErbB2-related cancer, identifying a subject at risk of developing ErbB2-related cancer, and for any screening or drug development. The kit is useful in carrying out the above methods. ABP99940 to ABB999206 represent specifically claimed EOPIs from the present invention

Novel support used for micro-arrays and its use in detection of (bio)

Example 3; Fig 6C; 41pp; English

molecules

The present invention relates to a method for the detection of biomolecules in pixel arrays and the supports used for the micro-arrays. The novel supports for the micro-arrays are suitable for determining the binding of a first member molecule within a library of spots of tentative first member binding molecules with a second member binding molecule. The support is provided with a support surface where surface patches are interspersed with surface areas that are materially distinct from the patches. The support and method of the invention are useful for identifying or obtaining a synthetic molecule comprising a binding site, or a binding molecule capable of binding to a binding site. The molecule is useful for interfering with, or effecting binding to a binding molecule. The novel support for a micro-array and the method provide high density arraying (testing many binding events in one go) and enzymelinked-assays (very sensitive) allowing the detection of more binding

The present invention relates to a method for the detection of biomolecules in pixel arrays and the supports used for the micro-arrays. The novel supports for the micro-arrays are suitable for determining the binding of a first member molecule within a library of spots of tentative first member binding molecules with a second member binding molecule. The support is provided with a support surface where surface patches are interspersed with surface areas that are materially distinct from the patches. The support and method of the invention are useful for identifying or obtaining a synthetic molecule comprising a binding site, or a binding molecule capable of binding to a binding to a binding molecule. The novel support for a micro-array and the method provide high density arraying (testing many binding events in one go) and enzymemore binding linked-assays (very sensitive) allowing the detection of more binding pairs more rapidly. ABU14074-ABU14254 represent human follicle-stimulating hormone (hFSH) derived peptides containing an N-terminal bromoacetamide group. These peptides are used in the method of the Example 3; Fig 6B; 41pp; English.

The novel supports for the micro-arrays are suitable for determining the binding of a first member molecule within a library of spots of tentative first member binding molecule with a second member binding molecule. The support is provided with a support surface where surface patches are interspersed with surface areas that are materially distinct from the patches. The support and method of the invention are useful for identifying or obtaining a synthetic molecule comprising a binding site, or a binding molecule capable of binding to a binding site. The molecule is useful for interfering with, or effecting binding to a binding molecule is useful for interfering with, or effecting binding to a binding many binding events in one go) and enzymelinked assays (very sensitive) allowing the detection of more binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pairs more rapidly. ABU14255-ABU14437 represent human follicle-
stimulating hormone (hFSH) derived peptides containing a C- or N-terminal
cysteine. These peptides are used in the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel support used for micro-arrays and its use in detection of (bio)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ð
The present invention relates to a method for the detection of biomolecules in pixel arrays and the supports used for the micro-arrays. The novel supports for the micro-arrays are suitable for determining the binding of a first member molecule within a library of spots of tentative first member binding molecules with a second member binding molecule. The support is provided with a support surface where surface patches are interspersed with surface areas that are meterially distinct from the patches. The support and method of the invention are useful for the contribing or obtaining a synthetic molecule comprising a binding site, or a binding molecule capable of binding to a binding site. The molecule for a micro-array and the method provide high density arraying (testing with, or effecting binding to a binding molecule. The novel support for a micro-array and the method provide high density arraying (testing many binding events in one go) and enzymelinked-assays (very sensitive) allowing the detection of more binding events are represent human follicle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              binding of a first member molecule within a bitrary of spots of tentative first member binding of a first member molecule within a bitrary of spots of tentative first member binding molecules with a second member binding molecule. The support is provided with a support surface where surface patches are interspersed with surface areas that are materially distinct from the patches. The support and method of the invention are useful for identifying or obtaining a synthetic molecule comprising a binding site, or a binding molecule capable of binding to a binding site. The molecule capable of binding to a binding the molecule. The novel support for a micro-array and the method provide high density arraying (testing many binding events in one go) and enzymelinked-assays (very sensitive) allowing the detection of more binding pairs more rapidly. ABU14255-ABU14437 represent human follicle-stimulating hormone (hRSH) derived peptides containing a C- or N-terminal cysteine. These peptides are used in the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for the detection of biomolecules in pixel arrays and the supports used for the micro-arrays. The novel supports for the micro-arrays are suitable for determining the
                                                                                                                                                                                                                                                                                                                                                                                                                         Novel support used for micro-arrays and its use in detection of (\mbox{bio}) molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Biomolecule detection; pixel array; micro-array support; andecule binding; binding molecule; support surface; surface patch; high density arraying; enzyme-linked-assay; bromoacetamide group; human follicle-stimulating hormone; hFSH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0

                                                                                                                                                                          The present invention relates to a method for the detection of biomolecules in pixel arrays and the supports used for the micro-arrays. The novel supports for the micro-arrays are suitable for determining the binding of a first member bolecule within a library of spots of tentative confirst member binding molecules with a second member binding molecule. The support is provided with a support surface where surface patches are interspersed with surface areas that are meterially distinct from the patches. The support and method of the invention are useful for identifying or obtaining a synthetic molecule comprising a binding site, or a binding molecule capable of binding to a binding site. The molecule capable of binding to a binding to a binding molecule capable of binding vents in one go) and enzymetolecule. The novel support for a micro-array and the method provide high density arraying (testing many binding events in one go) and enzymetolinked-assays (very sensitive) allowing the detection of more binding pairs more rapidly. ABUL4074-ABUL4254 represent human follicle.

                                                                                                                                                                           first conformationally constrained portion with a cross-linked group of HIV envelope protein that induces neutralising antibodies, and a second portion comprising a continuous stretch of at least 5 amino acids having a predicted secondary structure. The present sequence is one such peptide. The peptides of the present invention are useful as a vaccine for prophylactic or therapeutic treatment of a mammal for HIV infection
                                      Synthetic peptides useful for preventing and treating HIV infection in mammals, comprising a conformationally constrained portion and a portion with continuous stretch of amino acids of predicted secondary structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to peptides (AAB38548-B38970) comprising a first conformationally constrained portion with a cross-linked group of a HIV envelope protein that induces neutralising autibodies, and a second portion comprising a continuous stretch of at least 5 amino acids having a predicted secondary structure. The present sequence is one such applied. The peptides of the present invention are useful as a vaccine for prophylactic or therapeutic treatment of a mammal for HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic peptides useful for preventing and treating HIV infection in mammals, comprising a conformationally constrained portion and a portion with continuous stretch of amino acids of predicted secondary structure.
                                                                                                                                                            present invention relates to peptides (AAB38648-B38970) comprising
